

### Counting Atoms

Mg burns in air ( $O_2$ ) to produce white magnesium oxide,  $MgO$ .

How can we figure out how much oxide is produced from a given mass of Mg?

36

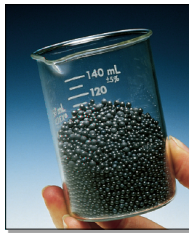

Syllabus Learning Outcomes : 5, 6, 7

### Counting Atoms

Chemistry is a quantitative science—we need a “counting unit.”

## MOLE

1 mole is the amount of substance that contains as many particles (atoms, molecules) as there are in exactly 12g of  $^{12}C$ .

518 g of Pb, 2.50 mol

### Particles in a Mole

**Avogadro's Number**  
Amedeo Avogadro  
1776-1856

$6.02214199 \times 10^{23}$

There is Avogadro's number of particles in a mole of any substance.

3

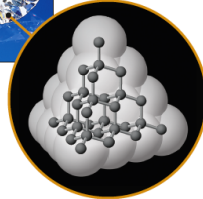

### Molar Mass

1.000 mol of  $^{12}C$   
= 12.00 g of  $^{12}C$   
=  $6.022 \times 10^{23}$  atoms of  $^{12}C$

12.00 g of  $^{12}C$  is its **MOLAR MASS**

Taking into account all of the isotopes of C, the molar mass of C is **12.011 g/mol**

4

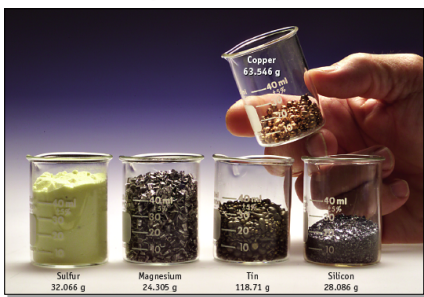

### Atomic Mass & Molar Mass

- Atomic Mass (u) - mass of one atom of an element relative to one atom of another element ( $^{12}C$ ) in atomic mass units.

- Molar Mass (g/mol) – mass in grams of 1 mole of atoms. Given on periodic table

5

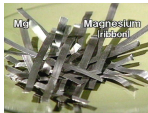

### One-mole Amounts

These are molar masses

6

7

**PROBLEM:** 0.200 g of Mg is what amount in mol? in atoms?

Mg has a molar mass of 24.305 g/mol.

$$0.200 \text{ g} \cdot \frac{1 \text{ mol}}{24.305 \text{ g}} = 8.23 \times 10^{-3} \text{ mol}$$

How many atoms in 0.200g of Mg?

$$8.23 \times 10^{-3} \text{ mol} \cdot \frac{6.022 \times 10^{23} \text{ atoms}}{1 \text{ mol}}$$

**=  $4.95 \times 10^{21}$  atoms Mg**

8

## Summary

- Convert back and forth between **number of atoms** and **moles** of an element (Avogadro's Number)
- Convert from **moles** of an element to **grams** using the molar mass (g/mol) from the Periodic Table.
- Calculate the **mass** (g) of one average **atom**.

9

## Laws of Chemical Combination

- **Law of Conservation of Mass**
  - The total mass remains constant during a chemical reaction.
- **Law of Definite Proportions**
  - All samples of a compound have the same composition, or ...
  - All samples have the same proportions, by mass, of the elements present.
- **Law of Multiple Proportions**
  - When two or more different compounds of the same two elements are compared, the *masses* of one element that combine with a fixed mass of the second element are in the ratio of small *whole* numbers.

10

## Mass is not the same as weight

- **Molecular mass:** sum of the masses of the atoms in a molecular formula in atomic mass units (u).
- Molecular mass is specifically for *molecules*.
- Ionic compounds don't exist as molecules; for them we use ...
- **Formula mass:** sum of the masses of the atoms or ions present in a *formula unit* in u.
- **Molar mass:** mass of 1 mole of molecules, atoms, or particles in grams (or grams/mol).

Terms frequently misused.

11

## Molecular mass / molar mass

---

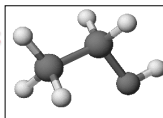

**Molecular mass** = sum of the atomic masses of all atoms in the molecule.

**Molar mass** = mass in grams of 1 mole of molecules, atoms, or particles

© 2006

12

## Find the molar mass of ethanol, $\text{C}_2\text{H}_6\text{O}$

**1 mol  $\text{C}_2\text{H}_6\text{O}$  contains**

2 mol C (12.011 g C/1 mol C) = 24.022 g C

6 mol H (1.008 g H/1 mol H) = 6.048 g H

1 mol O (15.999 g O/1 mol O) = 15.999 g O

**TOTAL = molar mass = 46.069 g/mol**

Calculate molar mass using all digits. Report correct SD for problem.

© 2006

### Molecular and empirical formulas

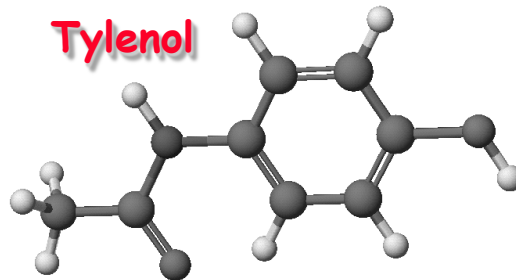

13

- A **molecule** is a group of two or more atoms held together by **covalent bonds**.
- A **molecular formula** gives the number of each kind of atom in a molecule.
- An **empirical formula** gives the simplest (whole number) ratio of atoms of elements in a compound.

| Compound          | Molecular formula              | Empirical formula |
|-------------------|--------------------------------|-------------------|
| Hydrogen peroxide | H <sub>2</sub> O <sub>2</sub>  | HO                |
| Octane            | C <sub>8</sub> H <sub>18</sub> | ????              |

© 2006

### Tylenol

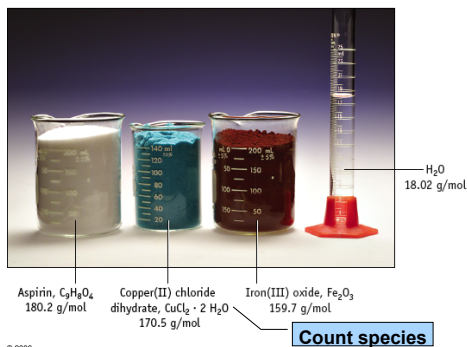

14

- Formula = **C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>**
- Molar mass = **151.2 g/mol**

© 2006

### Calculate Molar Masses at Home

15

© 2006

How many **moles** of alcohol are there in a “standard” can of beer if there are 21.3 g of C<sub>2</sub>H<sub>6</sub>O?

16

- (a) Molar mass of C<sub>2</sub>H<sub>6</sub>O = 46.069 g/mol  
 (b) Calc. moles of alcohol

$$21.3 \text{ g} \cdot \frac{1 \text{ mol}}{46.069 \text{ g}} = 0.462 \text{ mol}$$

© 2006

How many **molecules** of alcohol are there in a “standard” can of beer if there are 21.3 g of C<sub>2</sub>H<sub>6</sub>O?

17

We know there are 0.462 mol of C<sub>2</sub>H<sub>6</sub>O.

$$0.462 \text{ mol} \cdot \frac{6.022 \times 10^{23} \text{ molecules}}{1 \text{ mol}} = 2.78 \times 10^{23} \text{ molecules}$$

© 2006

How many **atoms of C** are there in a “standard” can of beer if there are 21.3 g of C<sub>2</sub>H<sub>6</sub>O?

18

There are  $2.78 \times 10^{23}$  molecules.  
 Each molecule contains 2 C atoms.  
 Therefore, the number of C atoms is

$$2.78 \times 10^{23} \text{ molecules} \cdot \frac{2 \text{ C atoms}}{1 \text{ molecule}} = 5.56 \times 10^{23} \text{ C atoms}$$

© 2006

19

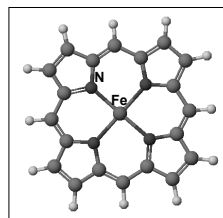

## Summary

- Calculate **molar mass** of a molecule using the **periodic table**.
- Convert between mass in **grams** for a molecule and number of molecules in **moles** using the molar mass of a molecule.
- Convert between **moles** and **number of molecules** using Avogadro's Number.
- Calculate the number of any particular **atoms** in a molecule using the **chemical formula**
- Define **molecular** and **empirical** formulas

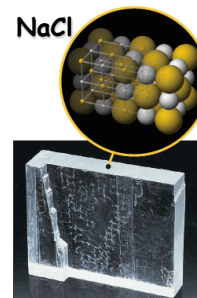

20

## Molecular & Ionic Compounds

Heme

NaCl

21

## Ions are atoms or groups of atoms with a charge

- When a metal reacts with a nonmetal, ions form.
- Ions arrange in a network called a crystal lattice.

22

## Ionic compounds are made of ions

- Ionic compounds are called salts.
- Usually contain a metal and a nonmetal
- Tend to have high melting points
- Tend to be hard solids and be crystalline
- Can be cleaved along a sharp boundary by causing breakage along the crystal lattice

23

## Define Cations and Anions

- Taking away an electron from an atom gives a **CATION** with a **positive charge**
- Adding an electron to an atom gives an **ANION** with a **negative charge**.

24

## Forming Cations & Anions

metals

nonmetals

A **CATION** forms  
when an **atom**  
**loses one or**  
**more electrons.**

An **ANION** forms  
when an **atom**  
**gains one or**  
**more electrons**

Cation

Mg 12 protons, 12 electrons

Anion

F 9 protons, 9 electrons

25

## PREDICTING ION CHARGES

In general

- **metals (Mg)** lose electrons → **cations**
- **nonmetals (F)** gain electrons → **anions**

26

## Charges on Common Ions

By losing or gaining e<sup>-</sup>, atom has same number of e<sup>-</sup>'s as nearest Group 8A atom.

27

## Predicting Charges on Monatomic Ions

| 1A              | 2A               |                  |                  |                 |                  |                  |                  |                  |                  |                  |                  | 3A | 4A | 5A | 6A              | 7A               | 8A              |  |

## Predicting Charges on Monatomic Ions

Figure 3.7 Charges on some common monatomic cations and anions. Metals usually form cations and nonmetals usually form anions. (The boxed areas show ions of identical charge.)

9

## Naming Metal Ions

$M \rightarrow n e^- + M^{n+}$   
where n = Group A number

**Na<sup>+</sup>** sodium ion  
**Mg<sup>2+</sup>** magnesium ion  
**Al<sup>3+</sup>** aluminum ion

Except name tin and lead ions as below

Transition metals use Stock system

**Fe<sup>2+</sup>** iron(II) ion  
**Fe<sup>3+</sup>** iron(III) ion

Except name Ag<sup>+</sup>, Zn<sup>2+</sup>, Cd<sup>2+</sup> as above

30

## Naming Nonmetal Ions

NONMETAL + n e<sup>-</sup> → X<sup>n-</sup>  
where n = 8 - Group A number

| Group 4A                  | Group 5A                  | Group 6A                  | Group 7A                   |
|---------------------------|---------------------------|---------------------------|----------------------------|
| C <sup>4-</sup> , carbide | N <sup>3-</sup> , nitride | O <sup>2-</sup> , oxide   | F <sup>-</sup> , fluoride  |
|                           |                           | S <sup>2-</sup> , sulfide | Cl <sup>-</sup> , chloride |
|                           |                           |                           | Br <sup>-</sup> , bromide  |
|                           |                           |                           | I <sup>-</sup> , iodide    |

Name derived by adding -ide to stem

| Name   | Formula                            | Typical Compound                       |
|--|------------------------------------|--|
| <b>Cation</b>  |                                    |  |
| Ammonium ion   | $\text{NH}_4^+$                    | $\text{NH}_4\text{Cl}$                 |
| <b>Anions</b>  |                                    |  |
| Acetate ion  | $\text{C}_2\text{H}_3\text{O}_2^-$ | $\text{NaC}_2\text{H}_3\text{O}_2$     |
| Carbonate ion  | $\text{CO}_3^{2-}$                 | $\text{Li}_2\text{CO}_3$               |
| Hydrogen carbonate ion (or bicarbonate ion) <sup>a</sup> | $\text{HCO}_3^-$                   | $\text{NaHCO}_3$                       |
| Hypochlorite ion   | $\text{ClO}^-$                     | $\text{Ca}(\text{ClO})_2$              |
| Chlorite ion   | $\text{ClO}_2^-$                   | $\text{NaClO}_2$                       |
| Chlorate ion   | $\text{ClO}_3^-$                   | $\text{NaClO}_3$                       |
| Perchlorate ion  | $\text{ClO}_4^-$                   | $\text{KClO}_4$                        |
| Chromate ion   | $\text{CrO}_4^{2-}$                | $\text{K}_2\text{CrO}_4$               |
| Dichromate ion   | $\text{Cr}_2\text{O}_7^{2-}$       | $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ |
| Cyanate ion  | $\text{OCN}^-$                     | $\text{KOCN}$                          |
| Thiocyanate ion <sup>c</sup>                             | $\text{SCN}^-$                     | $\text{KSCN}$                          |
| Cyanide ion  | $\text{CN}^-$                      | $\text{KCN}$                           |
| Hydride ion  | $\text{OH}^-$                      | $\text{NaOH}$                          |
| Nitrite ion  | $\text{NO}_2^-$                    | $\text{NaNO}_2$                        |
| Nitrate ion  | $\text{NO}_3^-$                    | $\text{NaNO}_3$                        |
| Oxalate ion  | $\text{C}_2\text{O}_4^{2-}$        | $\text{CaC}_2\text{O}_4$               |
| Permanganate ion   | $\text{MnO}_4^-$                   | $\text{KMnO}_4$                        |
| Phosphate ion  | $\text{PO}_4^{3-}$                 | $\text{Na}_3\text{PO}_4$               |
| Hydrogen phosphate ion                                   | $\text{HPO}_4^{2-}$                | $\text{Na}_2\text{HPO}_4$              |
| Dihydrogen phosphate ion                                 | $\text{H}_2\text{PO}_4^-$          | $\text{NaH}_2\text{PO}_4$              |
| Sulfite ion  | $\text{SO}_3^{2-}$                 | $\text{Na}_2\text{SO}_3$               |
| Hydrogen sulfite ion (or bisulfite ion) <sup>b</sup>     | $\text{HSO}_3^-$                   | $\text{NaHSO}_3$                       |
| Sulfate ion  | $\text{SO}_4^{2-}$                 | $\text{Na}_2\text{SO}_4$               |
| Hydrogen sulfate ion (or bisulfate ion) <sup>b</sup>     | $\text{HSO}_4^-$                   | $\text{NaHSO}_4$                       |
| Thiosulfate ion <sup>d</sup>                             | $\text{S}_2\text{O}_3^{2-}$        | $\text{Na}_2\text{S}_2\text{O}_3$      |

**Note: many O containing anions have names ending in -ate (or -ite).**

<sup>a</sup> The acetate ion is also represented as  $\text{CH}_3\text{COO}^-$ . <sup>b</sup> The prefix "bi-" means that the ion contains a replaceable H atom. This should not be confused with the prefix "bi-", which means two (usually used to represent a doubling of a simpler unit). <sup>c</sup> The prefix "thio-" means that a sulfur atom has replaced an oxygen atom. Copyright © 2004 Pearson Prentice Hall, Inc.

## Naming Polyatomic Ions

- Sulfate
- Sulfite
- Nitrate
- Nitrite
- Phosphate
- Dihydrogen phosphate
- Hydroxide
- Cyanide
- Acetate
- Ammonium
- Hypochlorite
- Chlorite
- Chlorate
- Perchlorate

Use exam handout for your homework

**Note: most oxygen-containing anions end in -ate (or -ite).**

## Writing Formulas of Compounds

- The total positive and negative charge must sum to zero (or to the charge on an ion).
- To write a proper formula, use the least common multiple or the crossover rule.
- The factors needed to balance the charge appear as subscripts in the formula.
- Use parentheses to group numbers of more than one polyatomic ion

## Writing Formulas and Naming Ionic Compounds

- Names of ionic compounds are built from the names of the positive and negative ions in the compound.
- The charge of elements that can have more than one charge is indicated with a Roman numeral in parentheses (Stock System).
- Be able to go back and forth between writing and naming compounds

- When writing a formula, the total charge must add to the charge on the substance, which is often zero

## Naming Ionic Compounds

|                           |                        |
|---------------------------|------------------------|
| $\text{NH}_4\text{NO}_3$  | ammonium nitrate       |
| $\text{CoSO}_4$           | Cobalt(II) sulfate     |
| $\text{V}_2\text{O}_3$    | Vanadium(III) oxide    |
| $\text{Ca}(\text{ClO})_2$ | Calcium hypochlorite   |
| $\text{KMnO}_4$           | potassium permanganate |
| $(\text{NH}_4)_2\text{S}$ | ammonium sulfide       |
| $\text{CuCl}$             | copper(I) chloride     |
| $\text{CuCl}_2$           | copper(II) chloride    |

## Electrostatic Forces

### COULOMB'S LAW

$$\text{Force of attraction} = k \frac{(n^+e)(n^-e)}{d^2}$$

proportionality constant      distance between ions

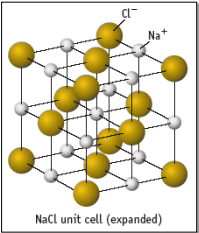

As ion charge increases, the attractive force \_\_\_\_\_.

As the distance between ions increases, the attractive force \_\_\_\_\_.

This idea is important and will come up many times in future discussions!

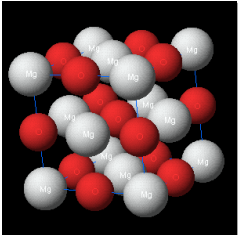

37

### Importance of Coulomb's Law

NaCl unit cell (expanded)

**NaCl, Na<sup>+</sup> and Cl<sup>-</sup>,  
m.p. 804 °C**

**MgO, Mg<sup>2+</sup> and O<sup>2-</sup>,  
m.p. 2800 °C**

38

### Molecular Compounds

- Molecular compounds are molecules (not ions) because electrons are shared by nonmetals.
- Can be gases to liquids to solids at room temperature
- Larger and more complex molecules tend to be solids

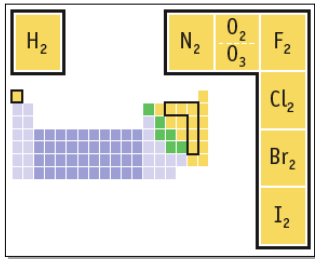

39

### Compounds & Molecules

- **COMPOUNDS** are a combination of 2 or more elements in definite ratios by mass.
- The character of each element is lost when forming a compound.
- **MOLECULES** are the smallest unit of a compound that retains the characteristics of the compound.

40

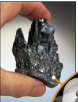

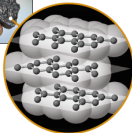

### ELEMENTS THAT EXIST AS DIATOMIC MOLECULES

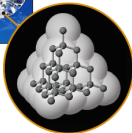

**H O N Cl Br I F**

41

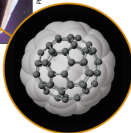

### ELEMENTS THAT EXIST AS MOLECULES

(a) Graphite

(b) Diamond

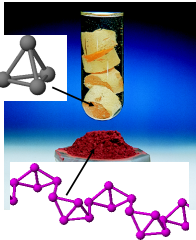

(c) Buckyballs

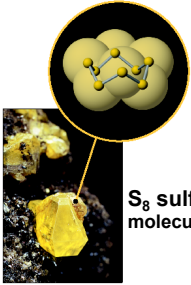

**Allotropes of C**

42

### ELEMENTS THAT EXIST AS POLYATOMIC MOLECULES

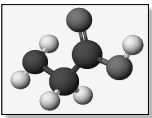

**White P<sub>4</sub> and polymeric red phosphorus**

**S<sub>8</sub> sulfur molecules**

43

Write molecular formulas for glycine

- $C_2H_5NO_2$
- $H_2NCH_2COOH$
- $H-N-C-C(=O)-O-H$
- 

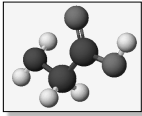

- One molecule contains
  - 2 C atoms
  - 5 H atoms
  - 1 N atom
  - 2 O atoms

44

WRITING FORMULAS

- Can also write glycine formula as  $-H_2NCH_2COOH$  to show atom ordering
- or in the form of a **structural formula**

$$\begin{array}{c} H & H & O \\ | & | & || \\ H-N-C-C-O-H \\ | \\ H \end{array}$$

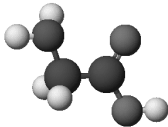

45

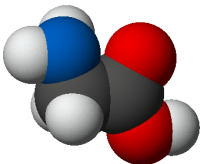

MOLECULAR MODELING

$$\begin{array}{c} H & H & O \\ | & | & || \\ H-N-C-C-O-H \\ | \\ H \end{array}$$

Structural formula of glycine

Ball & stick

Space-filling

Molecular Formula =  $C_2H_5NO_2$

46

Naming Molecular Compounds

- Binary compounds of hydrogen with oxygen, sulfur and the halogens (not aqueous):

HF

47

Naming Molecular Compounds

- For binary compounds for Groups 4A to 7A, write formulas with elements in order of increasing group number. Greek prefixes indicate numbers of atoms.

NF<sub>3</sub>

48

Naming Molecular Compounds

- For binary compounds for Groups 4A to 7A, write formulas with elements in order of increasing group number

|                                |                            |
|--------------------------------|----------------------------|
| CO <sub>2</sub>                | carbon dioxide             |
| PI <sub>3</sub>                | phosphorous triiodide      |
| SCl <sub>2</sub>               | sulfur dichloride          |
| N <sub>2</sub> F <sub>4</sub>  | dinitrogen tetrafluoride   |
| P <sub>4</sub> O <sub>10</sub> | tetraphosphorous decaoxide |

49

## Naming Molecular Compounds

- Many binary compounds of nonmetals were discovered years ago and have common names

|                                |               |
|--------------------------------|---------------|
| H <sub>2</sub> O               | water         |
| NH <sub>3</sub>                | ammonia       |
| CH <sub>4</sub>                | methane       |
| C <sub>2</sub> H <sub>6</sub>  | ethane        |
| C <sub>3</sub> H <sub>8</sub>  | propane       |
| C <sub>4</sub> H <sub>10</sub> | butane        |
| N <sub>2</sub> H <sub>4</sub>  | hydrazine     |
| PH <sub>3</sub>                | phosphine     |
| NO                             | nitric oxide  |
| N <sub>2</sub> O               | nitrous oxide |

50

Table 2.5 Formulas and Names of Some Common Acids and Their Salts

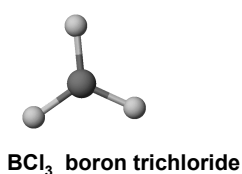

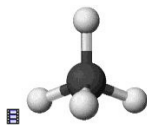

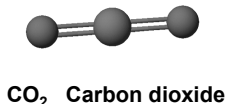

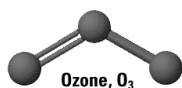

| Formula of Acid                             | Name of Acid       | Sodium Salt                     |                     |
|---|--------------------|---------------------------------|---------------------|
|   |                    | Formula                         | Name                |
| HCl   | Hydrochloric acid  | NaCl                            | Sodium chloride     |
| HClO  | Hypochlorous acid  | NaClO                           | Sodium hypochlorite |
| HClO <sub>2</sub>                           | Chlorous acid      | NaClO <sub>2</sub>              | Sodium chlorite     |
| HClO <sub>3</sub>                           | Chloric acid       | NaClO <sub>3</sub>              | Sodium chlorate     |
| HClO <sub>4</sub>                           | Perchloric acid    | NaClO <sub>4</sub>              | Sodium perchlorate  |
| H <sub>2</sub> S                            | Hydrosulfuric acid | Na <sub>2</sub> S               | Sodium sulfide      |
| H <sub>2</sub> SO <sub>3</sub> <sup>a</sup> | Sulfurous acid     | Na <sub>2</sub> SO <sub>3</sub> | Sodium sulfite      |
| H <sub>2</sub> SO <sub>4</sub> <sup>a</sup> | Sulfuric acid      | Na <sub>2</sub> SO <sub>4</sub> | Sodium sulfate      |
| HNO <sub>2</sub>                            | Nitrous acid       | NaNO <sub>2</sub>               | Sodium nitrite      |
| HNO <sub>3</sub>                            | Nitric acid        | NaNO <sub>3</sub>               | Sodium nitrate      |
| H <sub>3</sub> PO <sub>3</sub> <sup>a</sup> | Phosphoric acid    | Na <sub>3</sub> PO <sub>4</sub> | Sodium phosphate    |
| H <sub>2</sub> CO <sub>3</sub> <sup>a</sup> | Carbonic acid      | Na <sub>2</sub> CO <sub>3</sub> | Sodium carbonate    |

<sup>a</sup> Table 2.4 lists anions found in some salts of these acids in which not all of the available H atoms are replaced. If one or more H atoms remains unreplaced, formulas and names must be written accordingly; for example, NaHSO<sub>4</sub> is sodium hydrogen sulfate and NaH<sub>2</sub>PO<sub>4</sub> is sodium dihydrogen phosphate.

51

## Molecular Compounds Compounds without Ions

52

## Naming Molecular Compounds

All are formed from two or more nonmetals.

Ionic compounds generally involve a metal and nonmetal (NaCl)

54

End

## Naming Transition Metal Ions

- Most transition metals form more than one ion (Fe<sup>2+</sup>, Fe<sup>3+</sup>), so the Roman numeral is required for naming iron(II), iron(III).
- Common exceptions include Ag<sup>+</sup>, Zn<sup>2+</sup>, Cd<sup>2+</sup>, which form only these ions, and Sn and Pb, non-transition metals which form multiple ions.
